

Dermatological test

Inkontinence & Baby Diapers

We hereby declare that all raw materials used in Abena products with the label "Dermatologically tested", that are in direct skin contact, have all been Dermatologically tested and approved.

All raw materials are tested according to a 48 hours human patch test, each with a ref. study-no.

The tests are carried out at either Eurofins Germany or Bureau Veritas Germany.

At Abena we care about the users of our products, therefore we work together with our raw material suppliers regarding the condense of the raw material. We have written agreements with all our supplier regarding what we can accept in our raw materials.

On top of this we have all of our materials tested for skin irritation, this is done together with an external test laboratory.

How is the test conducted

- The test group consists of 20-25 people
- The test persons carries samples of the raw material on their skin for 48 hours
- All test persons are examines by a skin doctor before and after the application of the raw material
- Tests are been conducted when new products and raw materials are being introduced

Abena Benefits

The external test gives Abena and its products users an extra security that the products are as safe as possible and that our cooperation with our suppliers is strong and efficient regarding the contents of the raw materials.

Which raw material and products are tested

About 95% of all raw materials with direct skin contact used at Abena Produktion A/S have been tested according to above method or the raw materials are identical to already tested material.
